

P-1202

5     Abstract

10         A wear pad for insertion between a load to be lifted  
and a lifting device, such as a chain or wire cable of a  
crane, hoist or other lifting device, containing a  
cylindrical-shaped edge protector with a cut out section and  
10     raised edges on the outside surface of each cylindrical end  
of the edge protector, which edges extend around the  
circumference of the edge protector. The wear pad may  
further include an attachment element for attaching the edge  
protector to the load being lifted by the lifting device,  
15     such as a magnet.
